

Waze Cargo

Predictive routing intelligence for Chilean maritime trade

INVESTOR PITCH · 2026

The Problem

Chile moves **\$223.2B** in annual trade through its ports — yet every importer, exporter makes routing decisions **completely blind to what's coming**. No one can predict congestion before it strikes.

IMPORTERS — \$84.3B CIF

98.6% are SMEs

Importing machinery, electronics, vehicles, and pharmaceuticals. A **5-day delay** means empty shelves, missed deadlines, and contractual penalties.

⚠️ Cargo insurance does **not** cover commercial losses.

EXPORTERS — \$138.9B FOB

Chile is #1 in copper, and top exporter of fruit, salmon & lithium

A congested port during **grape harvest (March)** or **cherry season (December)** means spoiled perishables and lost contracts worth millions.

⊗ Both sides operate in fully **reactive mode**.

The Market Gap

Today's leading platforms — **MarineTraffic** (€100–150/mo) and **VesselFinder** (€40–120/mo) — offer live vessel maps, GPS-based ETAs, and historical route data.

✗ Today's Tools Tell You

"Your vessel is at sea, 450nm from San Antonio, ETA March 15 at 14:00."

- Will the port be congested when my cargo arrives?
- How many ships are expected that week?
- Will my grapes compete with copper for berth space?
- Are there swells that might close operations?
- Should I select a different port entirely?

⊗ None of these questions can be answered.

✓ Waze Cargo Tells You

"San Antonio will be 40% above capacity on March 15, with large swells — route through Valparaíso, 3 days faster."

- Port congestion predicted **12 months ahead**
- Commodity-level competition for berth space
- Seasonal patterns by product type
- Ocean swell disruption risk
- Alternative port recommendation

✓ Existing platforms answer "where." **Waze Cargo anticipate delays risks**

Competitive Landscape

The Intelligence Gap

MarineTraffic and VesselFinder have built strong businesses on vessel visibility. But visibility is not foresight.

Waze Cargo enters the market as a **complementary intelligence layer** — not a head-on competitor — adding predictive congestion modeling and commodity-level routing that no existing tool provides.

i Our moat is not the map. It is the model that predicts what the map looks like in 90 days.

How It Works: The Technical Foundation

Our robust infrastructure powers Waze Cargo's advanced predictive capabilities, combining a scalable data pipeline with sophisticated machine learning models to deliver precise forecasts.

Data Pipeline

- 20 million customs records processed
- Cloud-native AWS architecture
- S3 for raw storage
- Glue for ETL
- RDS PostgreSQL for structured database
- 65-second full retrain cycle

ML Pipelines

Two parallel pipelines:

Pipeline 1 – Port Congestion

- LightGBM model
- 78 port-direction pairs
- 49 features
- COVID-aware
- $R^2 = 0.909$
- 768 monthly forecasts for 2026

Pipeline 2 – Commodity Forecast

- LightGBM model
- 482 HS2+port pairs
- 3 targets: shipments + FOB + weight
- 5,784 commodity-port forecasts for 2026

Coming Next — Ocean Swell Integration

Our ML predicts demand-side congestion. But ports also close from physical conditions — swells, wind, and storm surges. We integrate Open-Meteo's marine API for 7-day forecasts of wave height, wave period, wave direction, and wind speed at each port location. The system accounts for port orientation — a west-facing port like San Antonio is vulnerable to Pacific swells that don't affect south-facing Coronel. Forecasts are segmented by Chile's three coastal zones (Norte, Centro, Sur) since weather patterns differ dramatically between Antofagasta's calm waters and the rough seas off Puerto Montt. When conditions exceed safe operational thresholds, the platform flags the port and recommends alternatives with better weather windows.

Who We Serve - Target Market

Waze Cargo addresses three distinct user profiles, each with a clear and measurable pain point tied to port unpredictability.

Small importers/exporters

Highest volume. Limited logistics teams.
Most vulnerable to delays. **Underserved technologically.**

Medium importers/exporters

Frequent trade, structured operations.
Willing to invest in predictive tools. Core revenue target.

Expansion targets

Freight forwarders · customs brokers · port authorities · logistics carriers · mining companies.

The pricing strategy is based on a competitive benchmark analysis of existing maritime platforms such as MarineTraffic and VesselFinder.
